

EASY GATE INSERT PANELS AND JOINERS

Insert panels are designed to be installed hard up against the inside stop of the easy gate frame receiver channel. You can then rivet through the concealed fixing area into the panel to secure in place. Once the cover is on these fixings will be concealed.

On larger gates you may have more than one panel and it will be necessary to install the supplied extruded rectangle section to the rear face of the joint between the panels. Neatly rivet the panels from the front into the joiner so that you have two rivets (one into each panel) about every 100mm for the entire length. These rivets can be painted with touch up paint if desired. (Do not spray the area to paint)

Finally use the supplied rubber extrusion to seal the front of the receiver channel and create a finished project.
